DESCRIPTION

This report lists Adverse Events that do not indicate worsened or exacerbated and match a Medical History event that is ongoing

COLUMN HEADING

1. Country
2. Site
3. Subject Number
4. AE Seq
5. AE Verbatim
6. APAE Seq
7. APAE Verbatim
8. MH Seq
9. MH Verbatim
10. APMH Seq
11. APMH Verbatim
12. LLT
13. Associated Partner LLT

LOGIC

Output is produced if Adverse Event/Associated Partner Adverse Event LLT matches Medical History/Associated Partner Medical History LLT and Medical History/Associated Partner Medical History entry indicates "YES" for "Is the medical history disease/condition or event still ongoing?", and AE/APAE verbatim term does not indicate a worsening or exacerbation of or increasing or increasing in frequency or increasing episodes or accelerated deteriorating or more bothersome or flare up or aggravated within the term.

LLT should not be null.

Do not output deleted records.

REPORT SCENARIOS

Output is produced if Adverse Event/Associated Partner Adverse Event LLT matches Medical History/Associated Partner Medical History LLT and Medical History/Associated Partner Medical History entry indicates "YES" for "Is the medical history disease/condition or event still ongoing?", and AE/APAE verbatim term does not indicate a worsening or exacerbation of or increasing or increasing in frequency or increasing episodes or accelerated deteriorating or more bothersome or flare up or aggravated within the term.

LLT should not be null.

Do not output deleted records.

SORTING

Defaulted to Country, Site number and Subject Number if not Specified

2. Logic Understanding

This report cross-references Adverse Event (and Associated Partner AE) records against Medical History (and Associated Partner MH) records by matching their LLT coded terms, for subjects where the matched Medical History entry is marked ongoing ('YES'). It then filters out any AE/APAE whose verbatim term suggests the event is merely a worsening/exacerbation of that pre-existing condition (using a defined list of worsening-indicator phrases), so that only AEs that appear to be a recurrence/match of an ongoing condition - not a worsening of it - are reported. Null LLTs and deleted records are excluded, and output is sorted by Country, Site, and Subject Number by default.
1. Identify pairs of records where the AE/APAE LLT matches the MH/APMH LLT - i.e., the LLT coded term for an Adverse Event (or its Associated Partner AE) is the same as the LLT coded term for a Medical History entry (or its Associated Partner MH) for the same subject.

2. For the matched MH/APMH record, check that it indicates 'YES' for the question 'Is the medical history disease/condition or event still ongoing?' - meaning the pre-existing condition has not resolved.

3. Examine the verbatim term of the matching AE/APAE record and confirm it does NOT contain language indicating worsening or exacerbation - specifically excluding terms like 'worsening', 'exacerbation', 'increasing', 'increasing in frequency', 'increasing episodes', 'accelerated', 'deteriorating', 'more bothersome', 'flare up', or 'aggravated' anywhere within the verbatim term.

4. Only when all three conditions hold together - LLT match (step 1), MH/APMH ongoing = YES (step 2), and AE/APAE verbatim does not indicate worsening (step 3) - is the record pair included in the output.

5. Apply a data-quality filter: the LLT value used for matching must not be null; if LLT is null on either the AE/APAE side or MH/APMH side, that record cannot be considered a valid match and is excluded.

6. Exclude any deleted records - if the AE, APAE, MH, or APMH record involved in a potential match is marked as deleted, do not include it in the output.

7. For each qualifying match, output one row containing Country, Site, Subject Number, AE Seq, AE Verbatim, APAE Seq, APAE Verbatim, MH Seq, MH Verbatim, APMH Seq, APMH Verbatim, LLT, and Associated Partner LLT - showing both the AE-side and MH-side identifying details plus both LLT values used in the match. *(inferred)*

8. Sort the final output by Country, then Site number, then Subject Number, per the default sorting rule since no other sort order was specified.

3. Spec Review

Readiness: Needs revision — The spec's core matching and exclusion logic is stated but has blocking gaps: the Report Scenarios section merely duplicates the Logic rather than providing testable examples, and the exclusion term-matching approach (and a likely typo, 'accelerated deteriorating') is ambiguous. Several other completeness/consistency issues (Associated Partner nullability, deletion scope, cross-matching rules) should also be clarified before query generation.

BLOCKING (testability): The Report Scenarios section is a verbatim copy of the Logic section rather than concrete example scenarios (e.g., specific input records and expected output/non-output). There is only one generic scenario described, so there's no way to verify distinct cases such as an AE with a worsening term being excluded, or a matched MH that is not ongoing being excluded. → Add discrete, concrete Report Scenarios (e.g., 'AE LLT matches MH LLT, MH ongoing=YES, AE verbatim contains no worsening language -> output row' and 'AE LLT matches MH LLT, MH ongoing=YES, AE verbatim contains "worsening" -> no output row') so each scenario can be independently tested against the Logic.

BLOCKING (ambiguity): The list of exclusionary terms/phrases ('worsening or exacerbation of or increasing or increasing in frequency or increasing episodes or accelerated deteriorating or more bothersome or flare up or aggravated') is not defined with exact matching rules -- it's unclear if this is case-insensitive substring matching, whole-word matching, synonym matching, or requires a coded/standardized list (e.g., a synonym/thesaurus lookup). 'Accelerated deteriorating' in particular reads as a possible typo or unclear compound phrase. → Specify exactly how verbatim term matching should be performed (e.g., case-insensitive substring search against a fixed term list) and confirm/correct ambiguous phrases like 'accelerated deteriorating' (possibly meant as 'accelerated' OR 'deteriorating').

WARNING (ambiguity): The Logic states 'LLT matches ... LLT' but does not specify whether this match must occur on the same subject only, whether both AE-to-MH and APAE-to-APMH pairings are required, or whether AE LLT can match APMH LLT cross-category (e.g., AE matching Associated Partner MH). → Clarify whether matching is restricted within the same category (AE<->MH, APAE<->APMH) per subject, or whether cross-matching (AE LLT to APMH LLT) is permitted/expected.

WARNING (completeness): The spec does not address how records with a null or missing APAE Seq/APMH Seq/Associated Partner fields (i.e., cases where there is no Associated Partner AE or MH) should be handled, even though these are listed as Column Headings (APAE Seq, APAE Verbatim, APMH Seq, APMH Verbatim, Associated Partner LLT). → State explicitly whether Associated Partner fields are optional/nullable in the output, and how the LLT-matching logic behaves when no Associated Partner record exists for a subject.

WARNING (completeness): The spec says 'Do not output deleted records' but does not specify which records (AE, MH, or both) this rule applies to, nor how 'deleted' is determined (a status field, a flag, etc.). → Specify which entity's deleted status is checked (AE, APAE, MH, APMH, or all) and identify the source field/flag used to determine deletion status.

INFO (consistency): The Description says the report lists AEs that 'do not indicate worsened or exacerbated' while the Logic/Scenario uses a longer, more specific list of terms (increasing frequency, episodes, accelerated deteriorating, more bothersome, flare up, aggravated). This is not strictly contradictory but the Description undersells the full exclusion criteria. → Update the Description to reference the full list of exclusion terms/phrases, or at least indicate 'see Logic for full list' to keep language consistent across sections.

INFO (naming): The spec does not state a naming convention for Form/Item references, and none of the fields (AE Seq, MH Seq, APAE Seq, APMH Seq) are tied to explicit source Form/Item names, making it hard to confirm consistency. → If a standard naming convention exists for Forms/Items in this CDM (e.g., AE.AESEQ, MH.MHSEQ), reference it explicitly in the spec so field provenance is unambiguous.

Built the core LLT-match logic from the confirmed metadata: AEFM (AETERMIT = verbatim, AESPIDIT assumed as the AE sequence identifier since no dedicated *SEQ item exists on AEFM) is explicitly joined to MHFM (MHTERMIT = verbatim, MHSPIDSEQIT = seq, MHENRFONGOINGIT = the ongoing Y/N item) on Subject ID, since matching is on LLT equality rather than shared event context. LLT comparison uses CODEDTERM(...,'LLT') on both terms, non-null AE LLT is enforced, deleted records are excluded via DELETEDFM tolerant of NULL on both forms, and the AE verbatim exclusion list covers worsen/exacerbat/increas/accelerat/deteriorat/bothersome/flare/aggravat substrings per the spec. IMPORTANT GAP: no Form or Item matching "Associated Partner Adverse Event (APAE)" or "Associated Partner Medical History (APMH)" was present anywhere in the provided study metadata (only SAE-specific partner forms SAEPFM/SAEIFM exist, which are not confirmed equivalents), so those four columns plus Associated Partner LLT are emitted as NULL placeholders rather than guessed Form/Item names -- please confirm the actual APAE/APMH source Forms via DESCRIBE FORM before running, and also verify the exact schema name (assumed `EDC`), the AE Seq item, and the literal coding of MHENRFONGOINGIT (assumed 'YES').
